Air Emissions

April 1, 2016 – March 31, 2017

This table compares air emissions from this supplier’s electricity mix to average emission levels from all New England power sources.

Supplier’s Mix (lbs/MWh)

Carbon Dioxide (CO₂) **837.32735**
This is equivalent to the average emission levels from all New England power sources

Nitrogen Oxide (NO_x) **0.74756**
This is equivalent to the average emission levels from all New England power sources

Sulfur Dioxide (SO₂) **0.89753**
This is equivalent to the average emission levels from all New England power sources

Notes: lbs/MWh = pounds per Megawatt-hour.
1 Megawatt-hour = 1,000 kilowatt-hours

Additional Information and Required Notes:

Power Sources: Maine law requires retail electricity providers to periodically provide information to their customers on the mix power sources used by the provider to serve their Maine customer’s load.

Emissions: Carbon Dioxide (CO₂) is released when certain fuels are burned. It is considered a greenhouse gas and a major contributor to global warming. Nitrogen Oxides (NO_x) form when certain fuels are burned at high temperatures. They are considered contributors to acid rain and ground-level ozone (or smog). Sulfur Dioxide (SO₂) is formed when fuels containing sulfur are burned. Major health effects associated SO₂ include asthma, respiratory illness and have other environmental impacts. Environmental impacts differ among individual power plants.
